INTRODUCTION

Over the past ten years, a number of economic, demographic, and changing lifestyle factors have caused substantial changes in the U.S. rental apartment market. More people are choosing to rent as an adaptable and cost-effective housing option as purchasing becomes more difficult as a result of growing real estate costs and increased mortgage rates. This study looks at important statistical insights into the rental market and shows how location, amenities, pet regulations, and other factors affect availability and rental costs. Landlords, real estate agents, and investors who want to proceed with responsible choices need to recognize these patterns.

This analysis makes use of R Studio and a large dataset that includes rental flats in different U.S. locations. Important characteristics including the number of bedrooms and bathrooms, the square footage of the apartment, the place of residence, and the rental costs are all provided by the dataset. We can determine pricing patterns and regional trends that represent tenant preferences and market demands by categorizing the rental properties and looking at things like pet-friendliness and amenity availability. Additionally, this study emphasizes the significance of various apartment amenities by demonstrating how they affect rental market pricing and consumer segmentation.

Additional Variable Information

The 10,000 rows and 22 columns of the data collection used in this research each correspond to a separate apartment feature. In order to guarantee accurate insights for additional research, the information has been pre-cleaned to assure the accurate representation of important columns like price and square feet. These factors include the physical attributes of the apartment, including the number of bedrooms and bathrooms, as well as its amenities, cost, and location.

An overview of the important variables in the dataset is provided below:

- **id**: A unique identifier for each apartment listing.
- **category**: The classification category of the apartment listing.
- **title**: The headline or title text of the apartment listing.
- **body**: The detailed description of the apartment.

- **amenities**: Features such as air conditioning, gym, pool, internet access, and more.
- **bathrooms**: The number of bathrooms in the apartment.
- **bedrooms**: The number of bedrooms in the apartment.
- **currency**: The currency in which the apartment's price is listed.
- **fee**: Any additional fees associated with renting the apartment.
- **has_photo**: Indicates whether a photo is available for the listing.
- **pets_allowed**: Specifies whether pets are allowed, and if so, what type (e.g., dogs, cats).
- **price**: The rental price of the apartment.
- **price_display**: The rental price as displayed to the user.
- **price_type**: The price converted into U.S. dollars (USD).
- **square_feet**: The size of the apartment in square feet.
- **address**: The street address of the apartment.
- **cityname**: The city where the apartment is located.
- **state**: The state where the apartment is located.
- **latitude**: The geographic latitude of the apartment.
- **longitude**: The geographic longitude of the apartment.
- **source**: The origin of the classified listing.
- **time**: The timestamp indicating when the listing was created.

Because of its versatility, this dataset can be used for a wide range of machine learning problems, such as regression analysis, filtering, and grouping, especially when the square feet variable is utilized as the objective. The dataset's full and abundance make it a perfect starting point for both statistical modeling and descriptive study of the US rental apartment market.

CHARTS AND GRAPHS

Price vs Square Feet

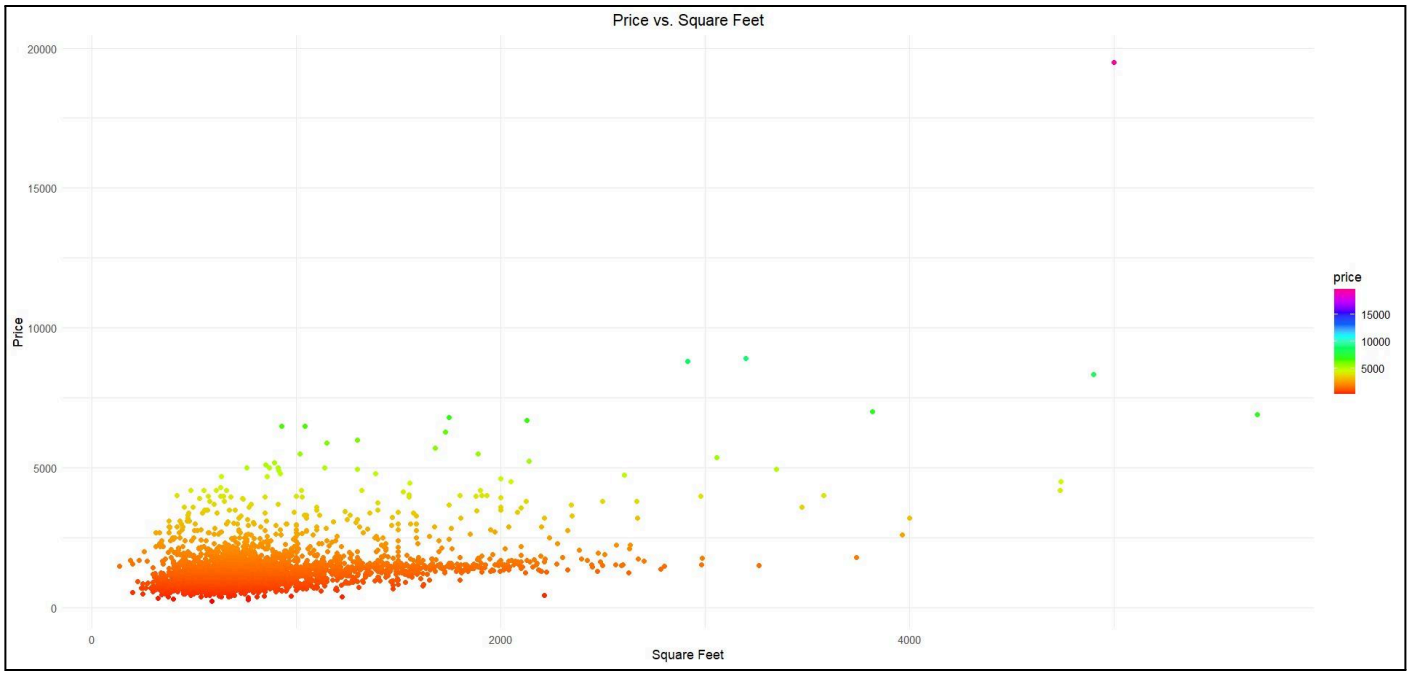

Figure 1 : *Price v. Square Feet | Scattered Plot*

Key Findings & Patterns

1. Particularly for larger homes, there is a noticeable tendency showing that price tends to climb in direct proportion to square footage. Largely comprising smaller homes priced around $5,000, the lower left portion of the graph shows a concentration of dots representing properties under 2,000 square feet.
2. Red indicates cheaper pricing, while violet/magenta indicates higher prices. The color gradient illustrates various price ranges. This also supports the size-price relationship. As you travel towards larger homes, you notice a change from more red (lower prices) to more green and violet (higher prices).
3. The upper right corner has a few noticeable outliers with values above $15,000 and considerably larger properties—beyond 4,000 square feet. These anomalies might be exclusive or well-located properties. Unexpectedly high costs are also displayed by a few smaller houses, which may indicate particular circumstances such as location or distinctive qualities that contribute to the price.
4. A significant portion of the properties are grouped in the lower price category between $0 and $5,000 and smaller than 2,000 square feet. This implies that the

majority of houses are reasonably priced, probably catering to the mid-range or lower-class market groups.

Business Strategy Implications

1. Given that the majority of properties are smaller than 2,000 sq. ft. and priced around $5,000, businesses might concentrate on catering to this important market niche. Here, tactics like providing bundled services or reasonably priced upgrades could work well.
2. The high-priced outliers indicate a specialized but possibly profitable premium market. Tailored services and other amenities can help set the offering apart for businesses aiming to attract this market.
3. The high prices of certain smaller houses suggest that they may have distinctive characteristics or prime locations that make them unique selling points. To profit from this trend, businesses should consider giving smaller areas a distinctive touch.
4. Marketing tactics should emphasize the value per square foot, particularly for larger houses, as price tends to rise with size.

Average Apartment Price by State

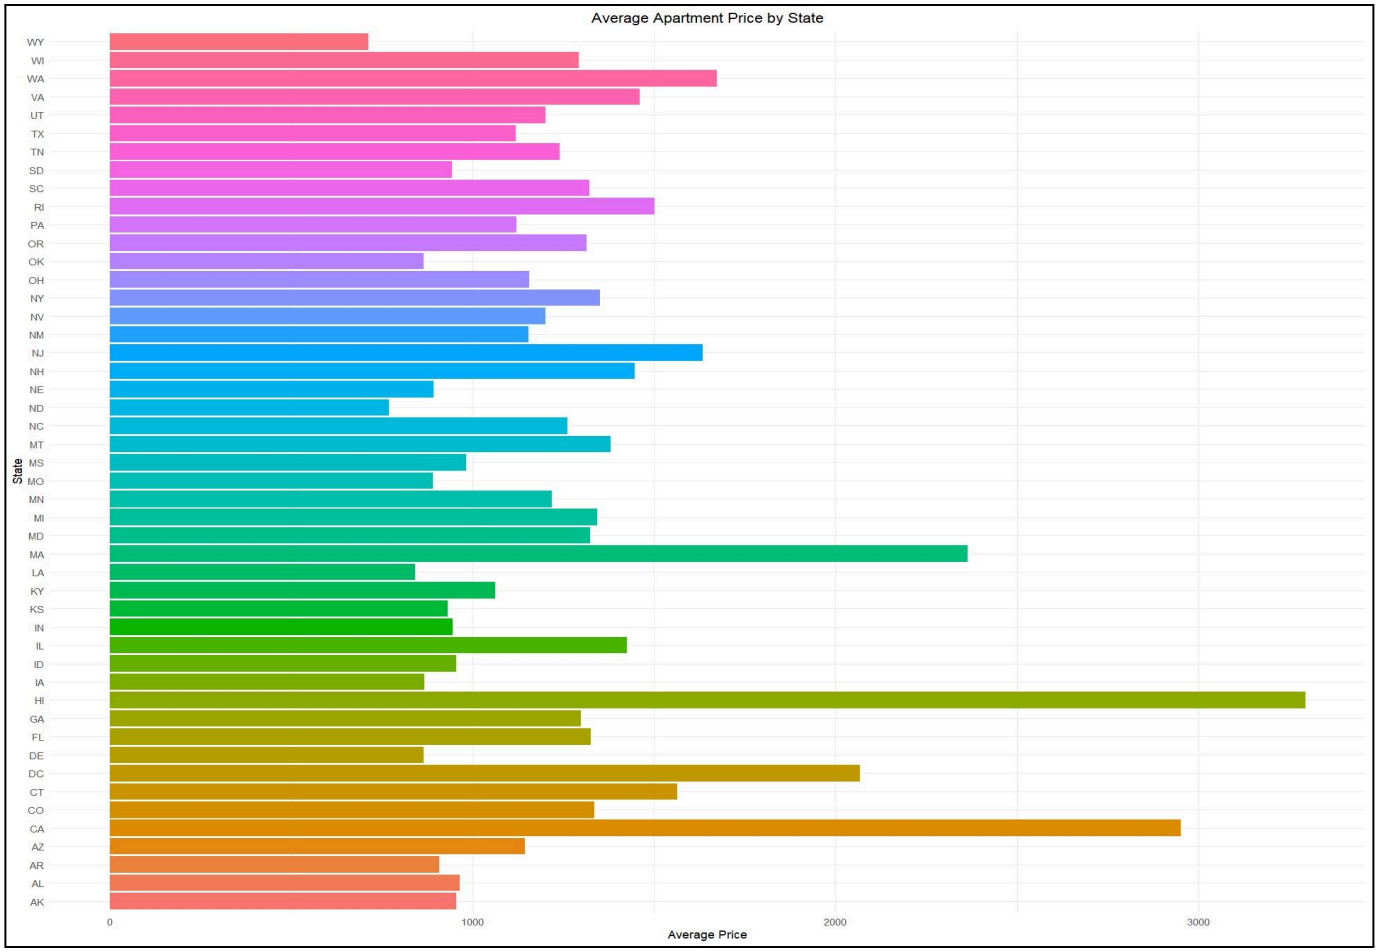

Figure 2 : *Average Apartment Price By State | Bar Chart*

Key Findings & Patterns

1. The apartment rental major forces of September already return to stasis. Some areas have seen resurgent demand for specific higher apartment rental markets. Los Angeles, New York, and Boston account for the high end of the market which is characterised by the market areas being densely populated and a high demand but limited housing stock.Reason: Availability of economic activities and growth of urban centers like LA, NYC or Boston is quite a major driver of the rental prices.
2. The states of Washington, Colorado and Florida seem to fall under the middle income group. This kind of state has high demand as average rental prices in cities such as Seattle, Denver and Miami are skyrocketing. The expansion of technology centers and the influx of the population in such states are making them more appealing and attractive but within reach as compared to the

first-ranking states; for instance NY and CA.

3. States like Wyoming, Arkansas, Indiana and Wisconsin have come out with average apartment prices which are tremendously lower which distorts a more even distribution. The average cost of rent and cost of living in these kinds of states are low thus renters are able to comfortably live there. Ohio is for many people a state which evokes facilities that rental rates are the most affordable as it is a mainly unanchored state.
4. Coastal and urban states tend to have higher apartment prices while Midwestern and Southern states generally show lower rental costs. For example, states like California and New York exhibit much higher average rental apartment prices than the other states because of the presence of so many high paying professionals industrious cities like Chicago and Dallas help lower prices because they are more widespread, catering to different demographic populations. Terminal cities with high internal economies (like technology, finance) commands a stiffer cost, while base limit as one goes away from these inner cities prices gets cheaper as they cater to different demographic needs.

Business Strategy Implications

1. High cost of housing development on the other hand has been limited by due access to all the main roads in a major Metro city which causes more elaborate developments like luxury apartments for construction within areas such as California, New York or Manhattan which offers good prospects on luxury apartment or high end rental units. This is because these states have urban sprawl bound by a healthy economy, high tech industry and many rich working people who have high demand towards urban housing. Such properties will benefit from energy efficient building systems, enhanced nutritional quality, smart house features, rooftops verdant, health club and concierge services. Specify the advertising high class urban dwellers, business people and foreign investors, tastefully designed urban apartments for sale or for rent are available.
2. Mid-priced states such as Washington, Colorado and Florida offer many possibilities to invest since demand for apartments is increasing and prices as well triggered by developments in the economy and increase in population. According to the strategy, real estate investors should focus their attention on buying properties located in cities with fast-growing opportunities such as

Seattle, Denver, and Miami before the prices catch up with top-rung markets. Mid-tier properties with an emphasis on young professionals and IT employees should do fine, more so with options of flexible leases or shared living arrangements.

3. States like Wyoming, Arkansas, Indiana, and Wisconsin can be lucrative for developing low-cost housing for such developments. These states are also likely to draw some segments of the populace searching for regions with affordable costs of living, more so with work becoming remote. In seeking to build affordable housing structures, property owners should look out for low-income housing programs offered by the government such as subsidized development, tax incentives, and various forms of grants. By concentrating on economical units and appealing to families, retirees and those where they are moving from high-cost areas businesses may appeal to this untapped niche market.
4. Adult-centered units are losing popularity because of rising numbers of American families which have pets and require pet-friendly apartments. The trend indicates that such constructions would serve a wider segment of the market. There is a possibility that managers and developers of properties could develop communities which accept pets through for instance provision of amenities such as dog parks, pet washing, and boarding services for pets. Besides this, property managers can introduce new streams of revenue throughout charging a pet rent or deposit.
5. Favoring greener buildings is an increasing trend among tenants (younger groups in particular) and as it should be therefore enhancing adding such features would be value add. Allocate resources into energy star rated appliances, features such as solar panels, less consuming water fittings and environmentally friendly construction materials. Many environmentally responsible renters are willing to pay increased rent for green features of the property and effective positioning of such features can be a good source of tenants.
6. Appropriate strategic pricing should take into account location and the inherent amenities one is offering. High-level example: In states such as California and New York rent prices can be higher because of where the properties are located and the demand while in low priced states cut throat competition should be at the center of the states. Business model of dynamic pricing is dependent on market and occupancy. Providing short-term rentals and other flexible lease options in

more urbanized areas, or offering supplementary amenities such as package deliveries, laundry as well as cleaning services.

7. It can be noticed that there is a trend of migration from expensive urban centers to affordable suburban or rural places. This means that states with lower costs of living are likely to appeal to renters. It would be appropriate for property developers and real estate dealers in places like Ohio, Utah, Kansas activities to move out to suburban or smaller city markets which are offering home space with office requirements and space designs in flexible form. There could be an advertising strategy focusing on lifestyle. It can be parks or trails nearby or community facilities.

Frequency of Apartment in Each State

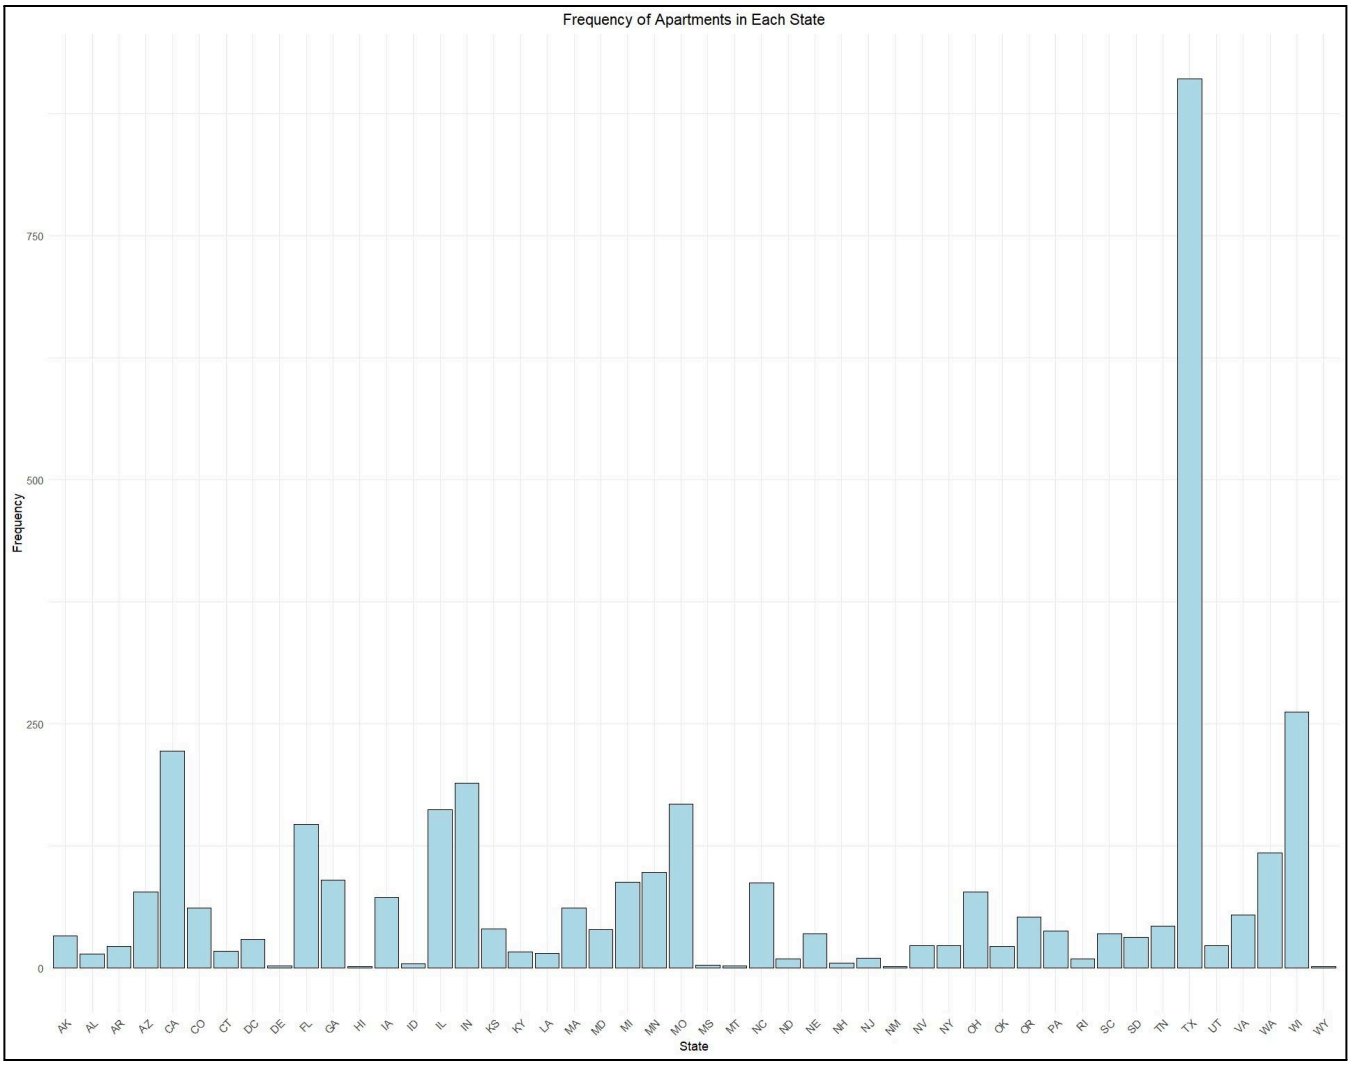

Figure 3 : *Frequency Of Apartments In Each State | Statistical Graphics*

Key Findings & Patterns

1. Compared to other states, Utah has a remarkably high incidence of apartments. This may be because of the following:
    a. Large demand for rentals, which could lead to a large concentration of apartment listings in this state.
    b. Urbanization or population growth.
    c. Notoriety in big cities such as Salt Lake City.
2. The apartment frequencies in states like California (CA), Texas (TX), Indiana (IN), Arizona (AZ), and Wisconsin (WI) are reasonably high. These could be locales with expanding metropolises or bustling rental markets.
3. While Maine (ME) and Delaware (DE) have relatively few listings, which may indicate lower demand or smaller rental markets, many states, including Colorado (CO), Kentucky (KY), Oregon (OR), and Washington (WA), have reasonable numbers of listings.
4. A few states exhibit extremely low apartment frequencies, including North Dakota (ND), Vermont (VT), and Wyoming (WY).

Business Strategy Implications

1. Utah is a top destination for services relating to apartments. A strong rental market is indicated by a high frequency of listings, and companies should concentrate on the following:
    a. Building apartments or investing in real estate
    b. Services for property management
    c. Hiring platforms or technology solutions to satisfy demand.
2. The frequency of apartments is significant but not overpowering in states like Arizona, Texas, and California. In these areas, potential strategies could be:
    a. Collaborating with nearby developers on new housing projects.
    b. Providing affordable tenant services or property management in thriving cities like Los Angeles, Austin, and Phoenix.
3. States with moderate frequencies, like Wisconsin and Indiana, can be seeing urbanization or population growth, which makes them perfect for new real estate ventures.
    a. Focusing on particular groups inside expanding cities, such as young professionals or students.

4. States with lower frequencies (like Wyoming, Vermont) can have undiscovered potential, particularly for luxury rentals, getaway homes, or niche markets in smaller cities or rural regions.
5. The Midwest, South, and West are among the robust regional markets indicated by the distribution. A regionalized approach that concentrates on the particular housing requirements of every area (family apartments, student housing, etc.) might work well.

Average Apartment Price by Pets Allowed

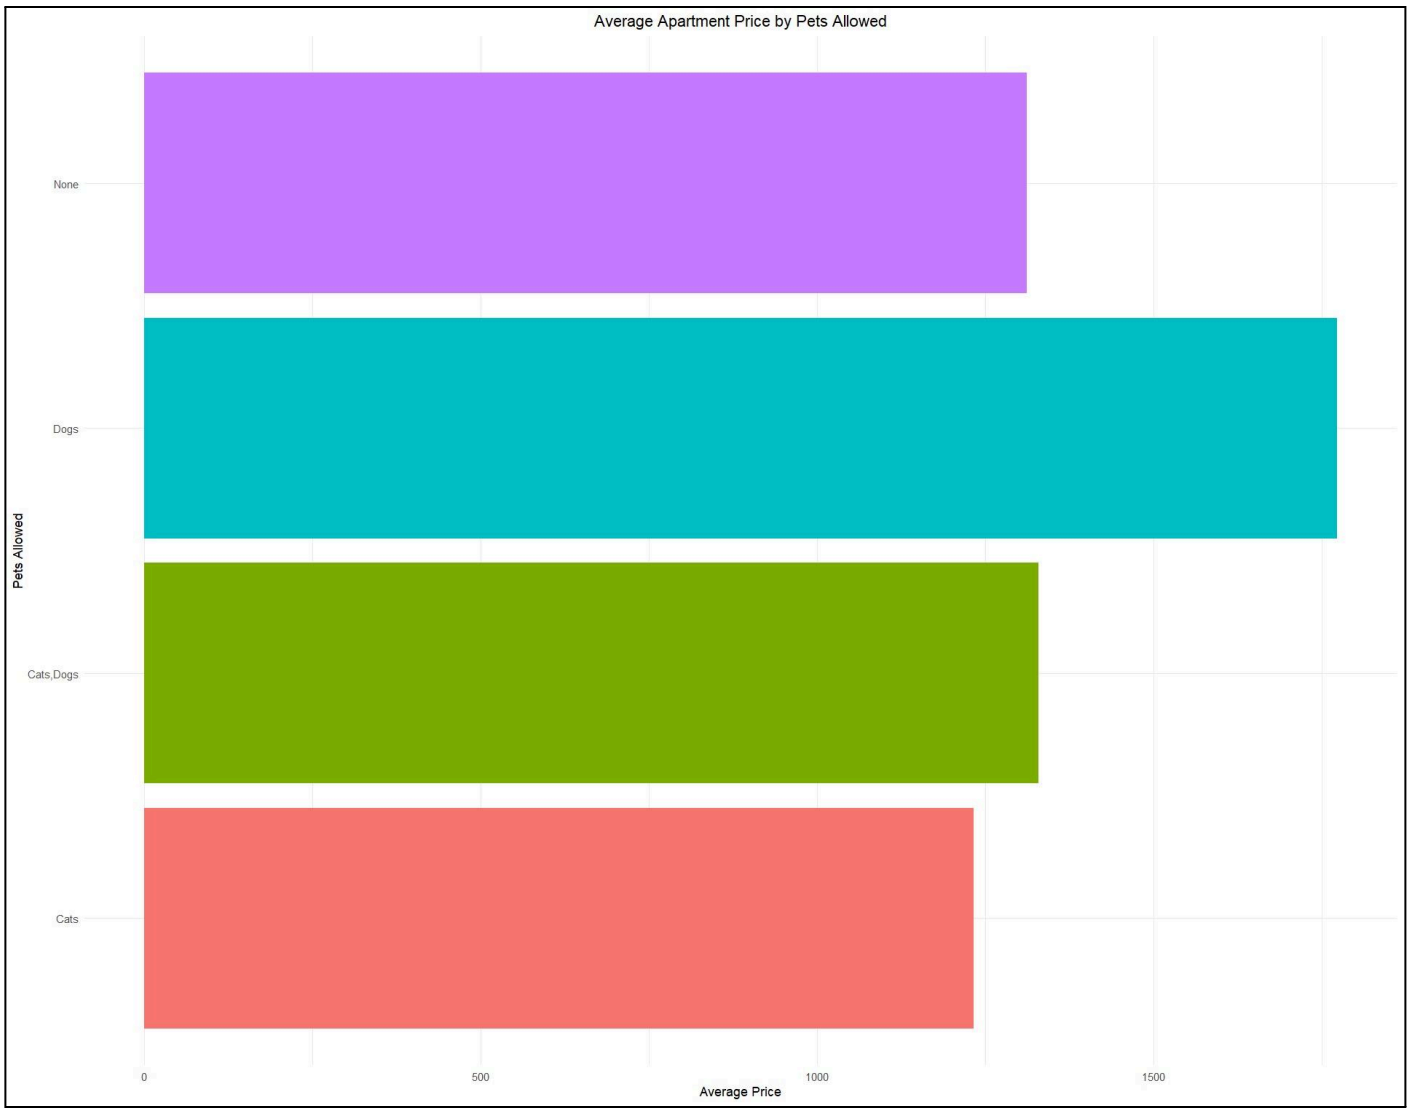

Figure 4 : *Average Apartment Price By Pets Allowed | Bar Chart*

Key Findings & Patterns

1. In general, the average cost of an apartment with dog restrictions is usually greater than that of an apartment with cat restrictions or without any pet restrictions. This implies that homes that allow dogs may be more expensive, perhaps as a result of:
    a. Dog owners must live in larger apartments.
    b. Extra facilities or services (pet-friendly areas, dog parks, etc.).
2. The average cost of apartments that accept both dogs and cats is somewhat less than that of apartments that only allow dogs. This may suggest that these establishments appeal to a wider range of pet owners by striking a balance between pet comforts and affordability.
3. The average cost of apartments with just cat restrictions is less than that of apartments with dog restrictions. One possible explanation for this could be the belief that cats need less room or amenities than dogs, which would save landlords money.
4. Remarkably, the average price of flats with a no-pets policy is in the middle range rather than the lowest. Considering that they cater to a different renter group, this implies that landlords who exclude dogs might not be drastically underpricing their homes.

Business Strategy Implications

1. Given that pet-friendly apartments typically command the greatest fees, companies that provide property management or rental services can consider targeting dog owners as a premium client. These apartments might have extra amenities like pet-friendly areas, dog parks, or bigger living areas.
2. 2.Dog-and cat-friendly apartments offer a chance to implement fair pricing policies. A broader range of renters could be drawn to these properties by emphasizing their flexibility for various kinds of pet owners in their marketing.
3. 3.Only-cat-friendly properties can be promoted as a more cost-effective choice for pet owners. Businesses may also exploit this to their advantage by positioning themselves in the low-cost rental market by providing reasonably priced flats that allow pets.

Price vs Bedrooms in Bathrooms

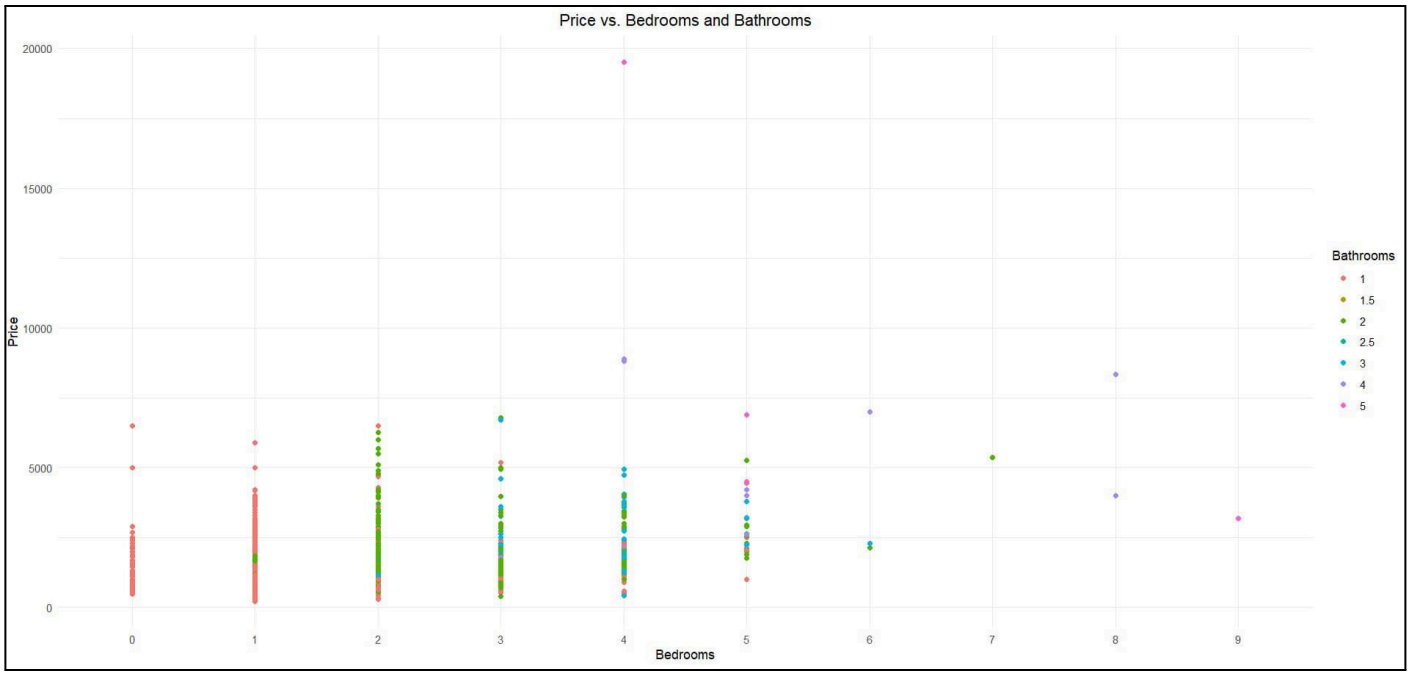

Figure 5 : *Price v. Bedrooms and Bathrooms | Dot Plot*

Key Findings & Patterns

1. In most cases, the price of apartments increases with an increase in the number of bedrooms. This is understandable as the larger apartments are designed for families or self-individuals who require more rooms. The jump in price is most pronounced when comparing 2 to 3 bedrooms but the trend continues more with the addition of more bedrooms. The outliers (higher premium units) are usually luxury or penthouses with more bedrooms.
2. Extra bathrooms (for example, 2.5, 3 and more) generally result in high costs which are significantly above average. As the bathroom count increases on a unit, the bedroom price starts to appreciate more especially on the three and more bedroom equipped units. Units with enhanced bathroom facilities tend to be charged at higher prices owing to extra comfort for the family or tenants who have roommates.
3. The 2-bedroom category comes out to be very competitive since the prices range widely as far as this category is concerned. Price ranges are observed in apartments developed due to the underlying characteristics like the area, the number of bathrooms and facilities in the unit. The presence of a second

bathroom is largely a major factor in escalating the cost of a 2 bedroom. 1 bathroom units tend to be cheaper, while units with 2+ bathrooms aim lower to high end range markets.

4. Figures having ultra luxurious features such as 6 or more bedrooms or 4 or more bathrooms are such that they develop niche markets. These apartments probably appeal to wealthy clients or large families looking for extra space and additional facilities offered within the apartment. These ultra-large units are rare and do not come cheap as they are highly priced because of their features like private swimming pools, high-class fittings among others which are characteristics of such properties.

Business Strategy Implications

1. Along with the bedrooms, the pricing must also take into account the value added by additional types of toilet facilities. Price elasticity of the latter attribute is quite high as we see that even if there are the same number of bedrooms per apartment, additional bathrooms tend to warrant higher prices. More advanced real estate developers and property managers will look into including more bathroom units in bigger size units 3+ bedrooms then looking for extra rental income The additional bathrooms in the communal sites resolve these issues for families or working professionals who tend to share accommodation arrangements.
2. This segment conveys pronounced pricing diversification, whereby mid-market and luxury segments are availed with respect to value enhancement on bathrooms count and rooms. There is a focus on two-bedroom units with 2 or more bathrooms for young professionals, small families or high-income tenants. There is potential in upgrading or designing 2 bedroom units to include higher end amenities including en-suite bathrooms walk in closets contemporary finishes for the more affluent tenants. These aspects should also be emphasized in marketing in order to appeal to the middle segment of the market.
3. Apartments offering four or more bedrooms with enhanced facilities are mostly considered part of the luxury vintage category that has great potential for profitability. Such apartments are probably targeted to the upper-end of the market or even large family head units situated in prime urban places. Each unit

with more than four bedrooms and more than three shelter rooms should be developed or altered in ways that would ensure luxury apartments. Upgrade typical standard finishes, space ordering, and basic add-ons (for example, a concierge and expensive appliances) to a higher level and charge higher fees as a result. Advertisements need to be targeted to this class, and what is more important, specifically this niche.

4. As for the small-sized apartments (1-2 bedrooms), it is important to do everything possible to keep prices low by eliminating superfluous amenities, particularly in low income markets. In mid level market segments where competition is stiff, there are functional units, but the focus is on stressed mid pricing places where there are more practical designs rather than extra luxurious features for small sized rooms. Locating one bathroom for 1-bedroom units and making sure that 2-bedroom, 1-bathroom units are placed at very low pricing will attract renters who have budget constraints.
5. Families and professionals alike do appreciate having more than one bathroom in a shared space. This is even more pronounced for units with 3+ bedrooms. There are features appealing to families which should be used in advertising campaigns, for example, the number of bathrooms, the number of rooms and their layout as well as the presence of separation between the rooms and the living area. The availability of units with 2.5 bathrooms or more should be emphasized in marketing in order to reach renters who value modern amenities such as increased privacy and convenience.
6. Properties with more than 2 bathrooms and the same number of bedrooms can go at much higher rents more so for the bigger apartments. Think about upselling units with extra bathrooms by emphasizing the value of convenience and privacy for tenants, especially during sharing. Cater to high-income professionals and renters who will pay extra for added comfort and privacy.

Apartment Prices By Platform

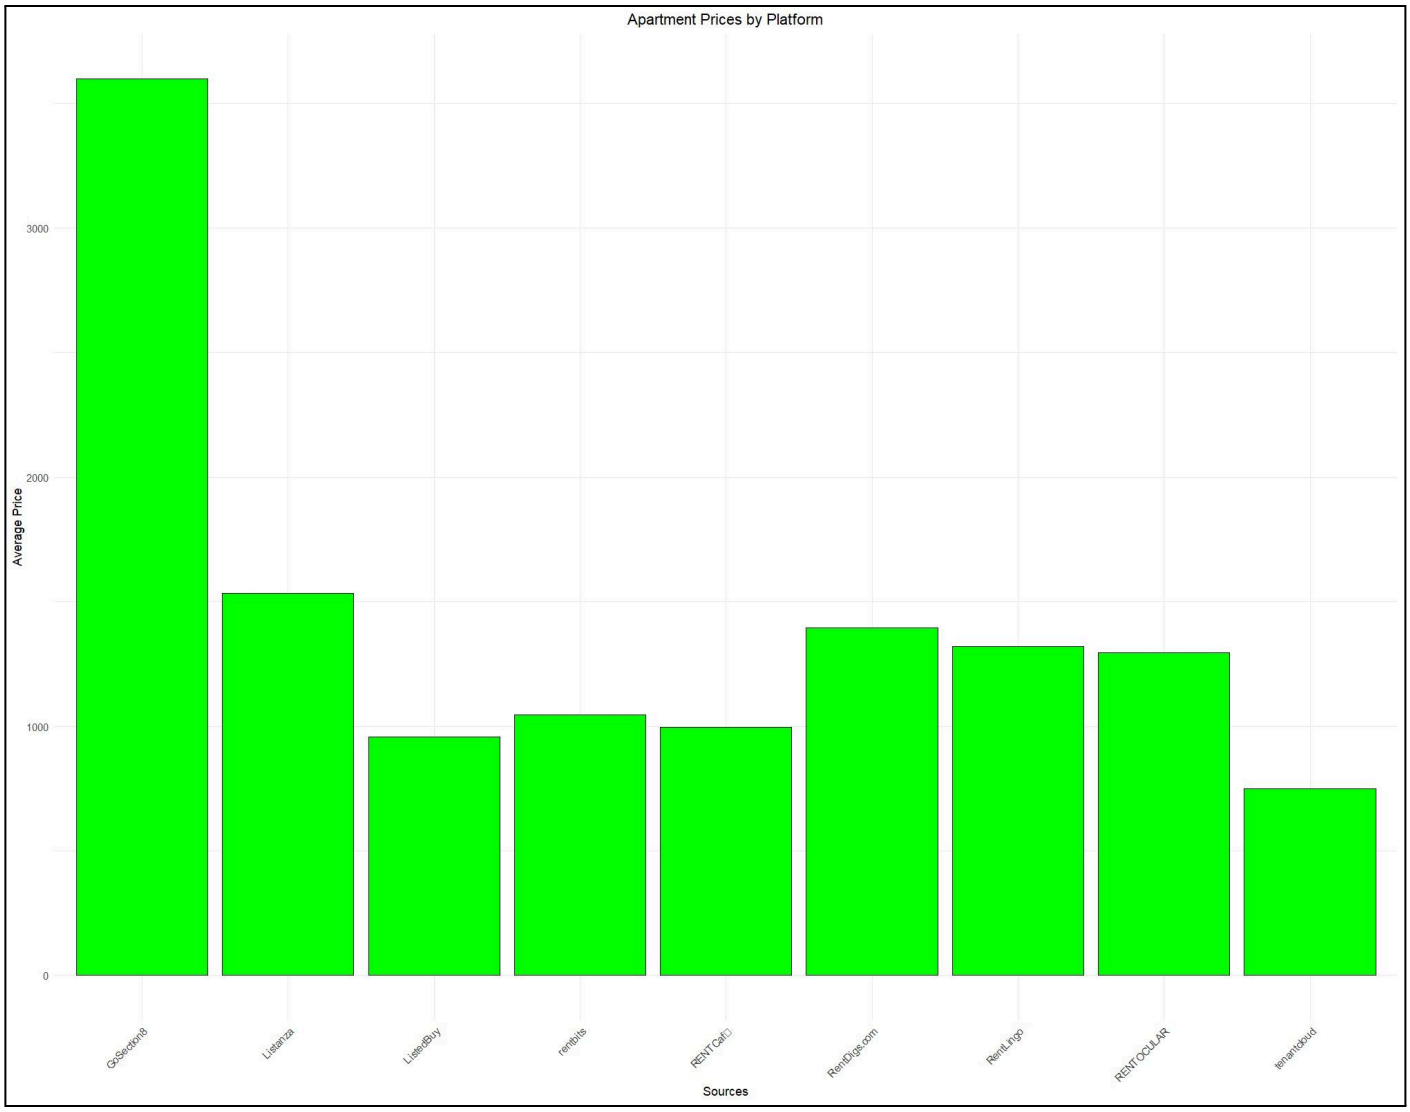

Figure 6 : *Apartment Price By Platforms | Column Chart*

Key Findings & Patterns

1. GoSection8 stands out from the other marketplaces with its much higher average prices. The reason for this could be specific listings (luxury apartments, homes in upscale neighborhoods, etc.). The more reasonable pricing on platforms such as Listanza, RENTCafe, RentHop, RentJungle, and RENTCOWAR suggests a more accessible or middle-class section of the apartment renting market. With their average pricing being lower, rentals24 and livablesty are positioned in a more affordable market.

2. The platforms are clearly separated into two categories: those with mid-to-low prices (GoSection8) and those with high prices (the others). Livablesty and rentals24 serve more cost-conscious or budget-conscious clients, whilst Listanza and RentHop seem to be aiming for middle-class demographics.

Business Strategy Implications

1. GoSection8 should be given priority when it comes to advertising and listing for businesses that specialize in luxury or niche rental homes. This platform may draw users who are looking for luxury apartments or homes in neighborhoods with high demand.
2. With reasonable price, platforms such as Listanza, RentHop, and RentJungle offer a chance to seize a sizable portion of the rental industry. These platforms might be perfect for companies in urban or suburban locations that offer conventional residences.
3. Renters on a tight budget or those seeking economical housing may find Livablesty and rentals24 to be useful resources. Businesses can choose to concentrate on providing discounts, promotions, or emphasizing affordability for tenants looking for less expensive solutions.

Pets Allowed Distribution

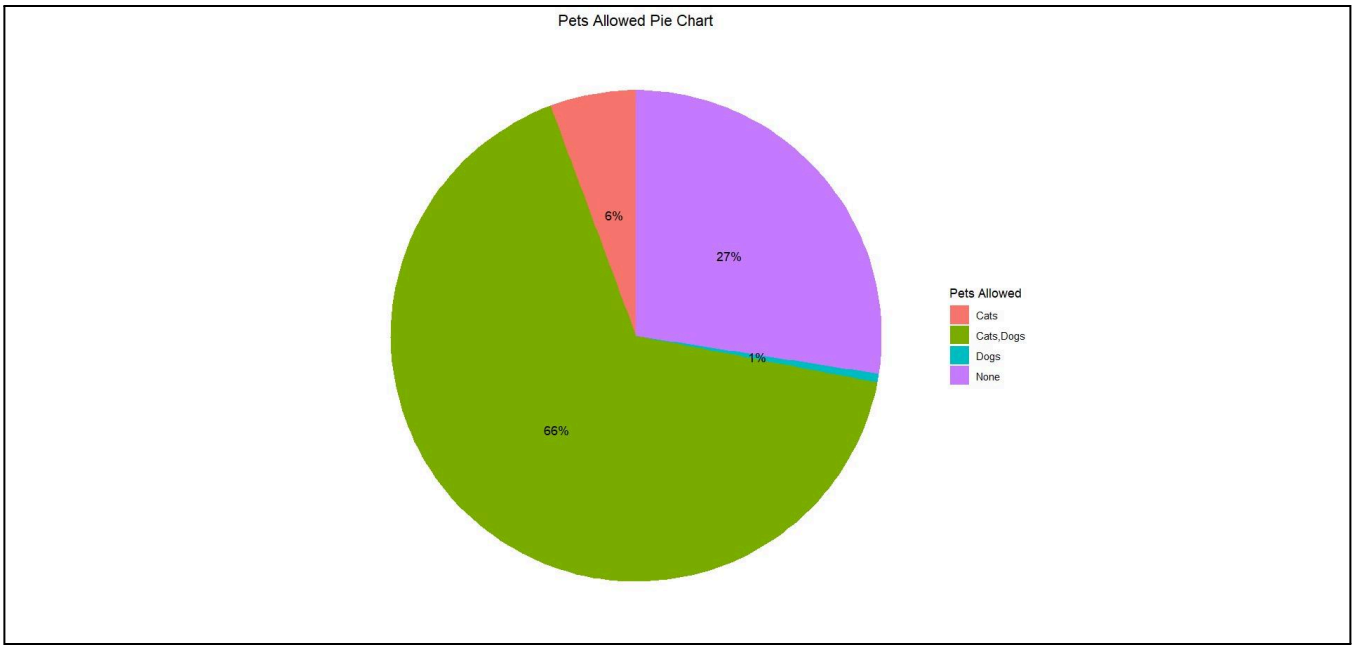

Figure 7 : *Pets Allowed Distribution | Pie Chart*

Key Findings & Patterns

1. Cats and dogs are permitted in the largest segment, which takes up 66% of the chart. This implies that the majority of pet-friendly buildings or establishments serve both common pet breeds, which makes them a desirable choice for future renters or clients who own either.
2. Pets are prohibited by 27% of the apartments in the chart. This category might accommodate people who have allergies or who would rather stay somewhere quieter if they don't want pets.
3. A lower percentage, 6%, solely permits cats. This would point to a specialized market for cat owners, perhaps in places where space is more of an advantage or where dogs are less common.
4. The least group, 1%, represents establishments or homes that exclusively permit dogs. Compared to the other categories, this is very uncommon and might be concentrated on more specialized residential or commercial settings.

Business Strategy Implications

1. Businesses should think about implementing more expensive pet rules in order to reach a wider audience, especially considering how popular the "cats and dogs allowed" category is. It could be beneficial to broaden services, including pet amenities.
2. Market niches such as "cats only" or "no pets allowed" can be targeted with marketing techniques to better meet the specific needs of such consumers, especially those who are renters or clients with certain requirements.
3. Businesses that concentrate on dogs or cats and fall into the 1% or 6% category can gain from developing distinctive value propositions that emphasize their commitment to serving a niche market.

RECOMMENDATIONS AND CONCLUSIONS

Recommendations

To boost apartment sales, focus on what renters want most:

- ***More space:*** Highlight the number of bedrooms and bathrooms, and any features that make the apartment feel bigger.
- ***Pet-friendly options:*** Make sure to mention if pets are allowed, especially dogs, as this can attract more renters.
- ***Showing off the best:*** Use great photos and virtual tours to give potential renters a good look at the apartment.
- ***Easy living:*** Point out convenient amenities like in-unit laundry or parking.

To further improve sales:

- ***Unique features:*** If the apartment has something special, make sure to mention it.
- ***Flexibility:*** Consider offering different lease lengths to attract more renters.
- ***Great service:*** Being helpful and friendly can make a big difference.
- ***Targeted marketing:*** Reach the right renters through online ads or local publications.

Conclusions

Accessing the rental market from several perspectives enables the particularities of the preferable marketing approaches.

- **High-Price Markets**: On the one hand, opportunities for the expansion of the client base at acceptable prices are available in mid-tier markets, while in states where the cost of apartments is high, the offer would rather be for high-end apartments and exclusive services.
- **Affordable Housing Initiatives**: The trend of lower-cost states could benefit from affordable housing initiatives targeting renters who are price sensitive.
- **Taking Pets to Work Policies**: The rising demand for apartments that allow dogs and cats is a business opportunity that can be helpful by lessening the restrictions on pets in apartments. In addition, it would suffice to mention broadened - pet specific- niche markets.
- **Price and Space link**: Particularly in expensive real estate, the relationship between the price of the apartment and the square meters thereof makes it clear that the concept of

space and cost must be counterbalanced alongside even the upscale market.

- **Preferences of Bedrooms and Bathrooms of the Management Team**: One or two bedrooms apartments will dominate the market, although premium end comprehensive properties with more bedrooms and bathrooms may entice more elusive tenants.
- **Geographic Focus**: Most of the offerings of apartments are concentrated in the states of Florida, Texas and California, which offer avenues for great demand. However, new and neglected markets offer relational business.
- **Data optimization**: As such, better strategies on the choice of the market to expand into or the development of the market will be possible with the rectification of the invalid or insufficient data.

Combining marketing activities with enhancements to the extras helps businesses achieve higher renter satisfaction as well as greater sales by improving the focal attributes of the apartments and the pet inclusive options in relation to the pricing of the locality.
